Subject:	Adjust kamaki store client and interface to use UUID as unique user identifier		
Description			
<p>Until now: Pithos storage service and Astakos identity manager used to uniquely identify users by their user/account name (usually an e-mail address). Now they use a Unique User ID.</p> <p>Target:</p> <ul style="list-style-type: none">- Kamaki can minimize config requirements, by demanding just a token from user. Then, kamaki.clients.astakos client will be used to get various user info- Astakos interface should provide a method for setting the uuid in config file (e.g. astakos uuid get/set)- Astakos client and interface must offer a translation mechanism between UUID and username or account- Pithos client be remain independent to astakos client, therefore, only documentation and naming changes will be considered in the basic functionality- Pithos interface can use astakos client to translate between UUIDs accounts for presentation purposes, as well as for easy group and permission setup
