<b>Subject:</b>	Avoid using user auth token as a parameter in user activation url		
<b>Description</b>			
<p>Although we invalidate the token when user successfully visits the activation url, it feels a bit bold and prone to cause security issues to use such sensitive information as a parameter to any astakos url.</p> <p>Astakos could generate a separate identifier for the email verification process.</p> <p>Identifier should be random, unique accross users and preferably contain only url safe characters.</p>
